XXXI. **Derivation of equation 8 and equations for Least-Squares Figure 4.**

Given the equilibria

\[
\frac{1}{2} \text{A}_2 \text{S}_2 + 2 \text{S} + \text{T} \rightleftharpoons \text{AS}_2 \text{T} + \text{S} \rightleftharpoons \text{AS}_3 + \text{T}
\]

such that

\[
K_1 = \frac{[\text{AS}_2 \text{T}]}{[\text{A}_2 \text{S}_2]^{1/2} [\text{S}][\text{T}]}
\]

and

\[
K_2 = \frac{[\text{AS}_3][\text{T}]}{[\text{AS}_2 \text{T}][\text{S}]} \tag{1}
\]

we can derive the equations describing the equilibrium constants as a function of solvent and organolithium concentrations. We define the total monomer concentration, \([\text{A}_T]\), such that

\[
[\text{A}_T] = [\text{AS}_2 \text{T}] + [\text{AS}_3]
\]

Substituting into equation 2 and rearranging affords

\[
[\text{AS}_2 \text{T}] = \frac{[\text{A}_T][\text{T}]}{(K_2)[\text{S}]+[\text{T}]}
\]

Squaring equation 1, substituting for \([\text{AS}_2 \text{T}]\), and rearranging affords

\[
\frac{[\text{A}_T]}{[\text{A}_2 \text{S}_2]} = K_1^2 [\text{S}]^2 ((K_2)[\text{S}]+[\text{T}])^2 \tag{3}
\]

Since the total LiHMDS concentration equals 0.10 M, then

\[
[\text{A}_2 \text{S}_2] = \frac{0.10 - [\text{A}_T]}{2}
\]

Substituting into equation 3 for \([\text{A}_2 \text{S}_2]\) and rearranging affords

\[
\text{A}_T^2 + \frac{-K_1^2 [\text{S}]^2 (K_2 [\text{S}]+[\text{T}])^2}{2} + \frac{(0.1)K_1^2 [\text{S}]^2 (K_2 [\text{S}]+[\text{T}])^2}{2} = 0
\]

Solving for \([\text{A}_T]\) using the quadratic equation affords

\[
[\text{A}_T] = \frac{-K_1^2 [\text{S}]^2 (K_2 [\text{S}]+[\text{T}])^2}{4} + \frac{K_1 [\text{S}](K_2 [\text{S}]+[\text{T}])}{2} \sqrt{\frac{K_1^2 [\text{S}]^2 (K_2 [\text{S}]+[\text{T}])^2}{4} + 0.2}
\]
