Computational Studies. Calculations based on density functional theory (DFT) were performed at the B3LYP/6-31G(d) level of theory using Gaussian 03 and visualized with GaussView 3.09.[3,4] Gibbs free energies (ΔG^{o}, kcal/mol) include thermal corrections at 298 K. Calculated transition structures were shown to be legitimate saddle points by the existence of a single imaginary frequency. The alkyl groups on the carbamate were modeled as methyl groups and LDA was modeled as lithium dimethylamide. THF and *n*-BuOMe were modeled as dimethylether. TMCDA was modeled as TMEDA. The following equilibrium equations have been balanced, so the energies can be compared.
