That the relative integration of the terminal methyl (~1.4 ppm) is significantly above 2 is consistent with predominant retention of protons from substrate without trapping of the allylsodium intermediate by DN*i*-Pr_2.

II. Computations

Geometries are optimized at the B3LYP level of theory using the 6–31G(d) basis set. Energies are defined as follows: G is the sum of electronic and thermal free energies calculated at the B3LYP level of theory (T = 195 K). G_{MP2} is derived from a MP2 single point calculation corresponding to the DFT-optimized geometry and includes a thermal correction from the DFT optimization.
